Linux Security App

Team Members:

Christopher Mai (chrmai1)

Description:

My final project will be a Linux security guide. This app will be a handbook of sorts, which will present the user with various tweaks and modifications. The app will contain will contain a table view for presenting the information in a table of contents format. In each section the app will detail in information pertaining to securing your Linux system with both text based explanations and code segments.

*I understand this might not be a very coding heavy project. However, I recently joined the UMBC security group which has a focus on Cyber Defense, for which we are creating a "battle book" of sorts which will be our game plan for locking down a Linux system and detailing steps to take when certain events happen. This is book is in preparation for CCDC in January in which we hope to compete. This was honestly the most unique idea I could come up with for an iphone app.
